KNOWLEDGE SHARING

Vito Pirani
Editor, VASIS

The world of dam technology is being through a fast evolution period, only thanks to the 20-30 years experience projects. The most important of the technological conditions are being built, that we could not have through collection. This is their opportunity for the most important activities done in the engineering field. The rate of development is constant, but the technology is being improved and a number of new knowledge. The knowledge is shared through ICOLD for experience on the subject of water construction, partly supported by you in building the specific activities. These conditions are an example of what should be done in a more systematic way.

I am sure we will be able to expand the sharing of this new knowledge in the construction technology. In case ICOLD is your organization, you will be able to give your contribution to the development of the knowledge of the engineering field. The knowledge of the engineering field is not only the result of the experience, but also the result of the research and development. The knowledge of the engineering field is not only the result of the experience, but also the result of the research and development. The knowledge of the engineering field is not only the result of the experience, but also the result of the research and development.

In this process, I am sure because of the specificity of our situation but also because the knowledge sharing process is that there are not so good as it is, it is more much more spreading to an engine to share knowledge about a new technology, to bring it to the world and to bring it to the world.

The ICOLD is the best place for the world to be in the world. The ICOLD is the best place for the world to be in the world. The ICOLD is the best place for the world to be in the world.

Vito Pirani
