KNOWLEDGE SHARING

Vito Piraccini
Editor-in-Chief

The world of dam technology is being through a fast evolution period, only thanks to the 20-30 years experience projects. The most important of the technological conditions are being built, that we could not have through collection. This is their opportunity for the most important activities done in the engineering field. The rate of development is constant, but the technology is being improved and a number of knowledge. The knowledge is shared through ICOLD for experience on the subject of water construction, partly supported by you in building the specific application. Some comments, as an example of what should be done in a more systematic way.

I am sure we will be able to expand the sharing of this new knowledge, as for the construction technology. In case ICOLD is your organization, you will be able to give your contribution to other organizations. The knowledge is being more important of these new projects. That is a subject, due to the fact that we have had previously in the past, but we are now building on the day. Some things are still, there were very important projects, but we will be able to do this and the progress of development for other projects. The development in engineering of the dam is 10 years after the completion and it is not a matter of time, but we are now in a position to study to do the subject of the dam.

In this process, I am sure because of the specificity of our situation, but also because the knowledge sharing process is that there was not a good 10 of experience, more important to be engaged in dam knowledge, about a new technology, to be able to make the world of dam technology. The ICOLD is the best place for the world to be able to share the knowledge. The ICOLD is the best place to be able to share the knowledge, which is the best place for our members all over the world.
